COSC 1P02 Notes

- Binary code is the only thing a CPU understands and is made of
  Bit which can only store a '0' or a '1'
  - An example of this is 0101101
  - The negation of that would be 1010010
  - You can also shift it to left and make it 0100100
  - A byte is an 8-bit slot which can store 8 bits
